Key Findings Exploring Access Logs

- There are few key lesson pages that consistently had high traffic across cohorts in both programs
    - Data Science(DS): Command Line Interface and Professional Development lessons from Appendix
    - Web Development(Web Dev): JavaScript – I/Introduction, Spring fundamentals, Html-CSS -II
- Each cohort for both programs had 1 or more students who hardly accessed the curriculum. They were accessing the materials less than 10% of the overall class access average.
- Both programs, the curriculum were accessed from IPs located all over the US and outside like Germany, Canada, Mexico, China, Ireland., United Kingdom, Australia, and China. Could mean use of VPN or the page is being accessed by third parties.
- Some IP addresses are found to be having really high page visits and some with really low. Needs monitoring or further exploration.
- Despite implementation of the measures to prevent cross access, the data shows that students have been able to cross access materials until the last day of data collection.
- Student access activities seem to jump up immediately post graduation. Majority of the students are seen accessing the materials from appendices and examples to freshen up their skills and concepts to prepare for interview.
